This document shall contain everything I have learned so far about nmap. I must keep it up-to-date because I feel a bit inundated in this cybersecurity journey to be frank.

1 Basic Nmap Commands

1.1 Service and Version Detection (-sV)

This is the Service Detection flag (*yes; -sV is a single flag, not a combination of both s AND V*), which will tell you the name and description of the identified services.

Service and Version Detection

```
$ sudo nmap -sV {target_IP}

Starting Nmap 7.80 ( https://nmap.org ) at 2025-03-28 06:27 GMT
Nmap scan report for 10.10.171.202
Host is up (0.00011s latency).
Not shown: 994 closed ports
PORT      STATE SERVICE      VERSION
7/tcp     open  echo
9/tcp     open  tcpwrapped
13/tcp    open  daytime?
17/tcp    open  qotd?
22/tcp    open  ssh          OpenSSH 9.6p1 Ubuntu 3ubuntu13.5 (Ubuntu
Linux; protocol 2.0)
8008/tcp   open  http         lighttpd 1.4.74

2 services unrecognized despite returning data. If you know the
service/version, please submit the following fingerprints at
https://nmap.org/cgi-bin/submit.cgi?new-service :
# [Detailed fingerprint data omitted for brevity]

MAC Address: 02:89:EC:B7:74:EF (Unknown)
Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel

Service detection performed. Please report any incorrect results
at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 14.00 seconds
```

1.2 Default Script Scan (-sC)

I sometimes use this one instead of `-sV` because it runs *default scripts*¹, which can give out additional information depending on the services running on the target. You can see a comparison in outputs between the two flags in the two boxes below.

Default Script Scan

```
$ sudo nmap -p- -sC {target_IP} # Do you notice how I had to scan all ports, not
just the top 1000 most common?

Starting Nmap 7.80 ( https://nmap.org ) at 2025-03-28 09:22 GMT
Nmap scan report for 10.10.219.233
Host is up (0.00024s latency).

993/tcp   open  ssl/imap     Dovecot imapd
995/tcp   open  ssl/pop3     Dovecot pop3d
MAC Address: 02:DD:7B:88:3D:75 (Unknown)
Service Info: Host: debra2.thm.local; OS: Linux; CPE: cpe:/o:linux:linux_kernel

Service detection performed. Please report any incorrect results
at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 13.00 seconds
```

1.3 OS Detection (-O)

Nmap sends a series of TCP and UDP packets to the remote host and examines practically every bit in the responses.

OS Detection Scan

```
$ sudo nmap -O {target_IP}

Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-28 18:41 +03
Nmap scan report for # {redacted}
Host is up (0.0044s latency).
Not shown: 994 closed tcp ports (reset)
PORT      STATE SERVICE
21/tcp    filtered ftp
22/tcp    filtered ssh
23/tcp    filtered telnet
53/tcp    open  domain
80/tcp    open  http
8022/tcp  filtered oa-system
MAC Address: # {redacted}
Device type: general purpose
Running: Linux 3.X|4.X|5.X
OS CPE: cpe:/o:linux:linux_kernel:3 cpe:/o:linux:linux_kernel:4
       cpe:/o:linux:linux_kernel:5
OS details: Linux 3.10 - 4.11, Linux 5.10 - 5.13
Network Distance: 1 hop
```

1.4 Aggressive Scan

What if you can have both OS detection and version detection with a single scan? That's what the aggressive scan is for. It enables OS detection, version detection, script scanning, and traceroute.

Aggressive Scan

```
$ sudo nmap -A {target_IP}

Starting Nmap 7.80 ( https://nmap.org ) at 2025-03-28 09:21 GMT
Nmap scan report for 10.10.219.233
Host is up (0.0062s latency).

```

2 Host Discovery

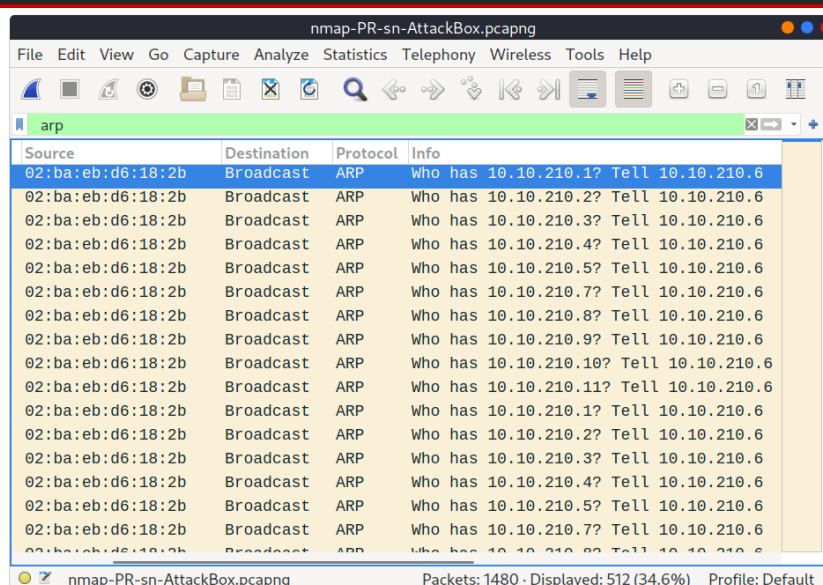

2.1 ARP Scan (-PR)

The ARP scan, `-PR`, is what you'd typically use if you're already in the network that you want to scan for live systems. The `-sn` flag here is necessary because it prevents nmap from scanning for open ports after the ARP scan.

ARP Scan

```
$ sudo nmap -sn -PR 192.168.100.7/24

Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-29 02:07 +03
Nmap scan report for 192.168.100.1
Host is up (0.0016s latency).
MAC Address: # This will show for all the live hosts, for all the
upcoming Discovery Host scans in this document, but I'll redact
them just in case.
Nmap scan report for 192.168.100.9
Host is up (0.092s latency).
Nmap scan report for 192.168.100.12
Host is up (0.054s latency).

Figure 1: Wireshark capture of ARP scan packets, a network different from the aforementioned by the way.

2.2 ICMP Scans

We'd rarely send these ICMP packets for the discovery of our system's own subnet, ARP Scans would be better in that case since firewalls tend to block ICMP packets a lot.

2.2.1 Echo Scan (-PE)

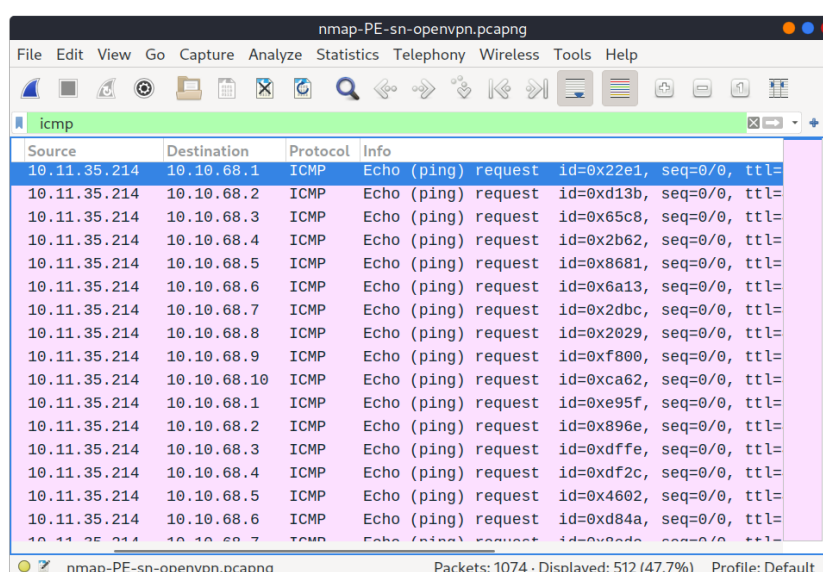

Either way, the -PE scan sends the ICMP Type 8 packets (i.e. same as your ping command).

ICMP Echo Scan (-PE)

```
$ sudo nmap -sn -PE 192.168.100.7/24

Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-29 03:06 +03
Nmap scan report for 192.168.100.1
Host is up (0.0039s latency).
Nmap scan report for 192.168.100.12
Host is up (0.33s latency).
Nmap scan report for 192.168.100.13
Host is up (0.74s latency).
Nmap scan report for 192.168.100.15
Host is up (0.072s latency).
Nmap scan report for 192.168.100.16
Host is up (0.32s latency).
Nmap scan report for 192.168.100.25
Host is up (0.11s latency).
Nmap scan report for 192.168.100.28
Host is up (0.73s latency).
Nmap scan report for 192.168.100.7
Host is up.
Nmap done: 256 IP addresses (8 hosts up) scanned in 9.18 seconds
```

Do you notice how it discovered 8 devices, whilst the previous ARP scan discovered 9?

Source	Destination	Protocol	Info

10.11.35.214	10.10.68.5	ICMP	Echo (ping) request id=0x4602, seq=0/0, ttl=
10.11.35.214	10.10.68.6	ICMP	Echo (ping) request id=0xd84a, seq=0/0, ttl=
10.11.35.214	10.10.68.7	ICMP	Echo (ping) request id=0x80dc, seq=0/0, ttl=

Figure 2: Wireshark capture of Echo Request packets, a network different from the aforementioned by the way.

2.2.II Timestamp Scan (-PP)

Because ICMP echo requests tend to be blocked, you might also consider ICMP Timestamp (ICMP Type 13) to tell if a system is online.

ICMP Timestamp Scan (-PP)

```
$ sudo nmap -sn -PP 192.168.100.7/24

Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-29 03:53 +03
Nmap scan report for 192.168.100.1
Host is up (0.0016s latency).
Nmap scan report for 192.168.100.9
Host is up (0.075s latency).
Nmap scan report for 192.168.100.12
Host is up (0.12s latency).
Nmap scan report for 192.168.100.13
Host is up (0.083s latency).
Nmap scan report for 192.168.100.14
Host is up (0.058s latency).
Nmap scan report for 192.168.100.15
Host is up (0.033s latency).
Nmap scan report for 192.168.100.16
Host is up (0.073s latency).
Nmap scan report for 192.168.100.25
Host is up (0.077s latency).
Nmap scan report for 192.168.100.7
Host is up.
Nmap done: 256 IP addresses (9 hosts up) scanned in 14.88 seconds
```

We got "9 hosts up" once again!

Source	Destination	Protocol	Info
10.11.35.214	10.10.68.1	ICMP	Timestamp request id=0xb6bf, seq=0/0, ttl=64
10.11.35.214	10.10.68.2	ICMP	Timestamp request id=0xcad3, seq=0/0, ttl=64

2.2.III Address Mask Scan (-PM)

Similarly, Nmap uses address mask queries (ICMP Type 17) and checks whether it gets an address mask reply (ICMP Type 18).

ICMP Address Mask Scan (-PM)

```
$ sudo nmap -sn -PM 192.168.100.7/24

Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-29 03:53 +03
Nmap scan report for 192.168.100.1
Host is up (0.042s latency).
Nmap scan report for 192.168.100.12
Host is up (0.21s latency).
Nmap scan report for 192.168.100.13
Host is up (0.21s latency).
Nmap scan report for 192.168.100.15
Host is up (0.10s latency).
Nmap scan report for 192.168.100.16
Host is up (0.19s latency).
Nmap scan report for 192.168.100.25
Host is up (0.071s latency).
Nmap scan report for 192.168.100.28
Host is up (1.5s latency).
Nmap scan report for 192.168.100.7
Host is up.
Nmap done: 256 IP addresses (8 hosts up) scanned in 9.39 seconds
```

Source	Destination	Protocol	Info
10.11.35.214	10.10.68.1	ICMP	Address mask request id=0xa3c4, seq=0/0, ttl=
10.11.35.214	10.10.68.2	ICMP	Address mask request id=0xb793, seq=0/0, ttl=

10.11.35.214	10.10.68.6	ICMP	Address mask request id=0x8300, seq=0/0, ttl=
10.11.35.214	10.10.68.7	ICMP	Address mask request id=0x74e0, seq=0/0, ttl=

Figure 4: Wireshark capture of Address Mask Request packets.

Bonus: if you were to NOT specify one of the techniques above, just used **nmap -sn** with no other flags, Nmap's default behaviour would be to reverse-DNS online hosts. And to skip that, you can use **-n** flag.

2.3 TCP/UDP Host Discovery

2.3.I TCP SYN Scan (-PS)

Nmap will send TCP SYN packets and won't complete the TCP 3-way handshake even if the port is open, as shown in the figure below the terminal's output. By default, Nmap will send the SYN packet to port 80.

TCP SYN Scan (-PS)

```
$ sudo nmap -PS -sn 10.10.68.220/24

Starting Nmap 7.92 ( https://nmap.org ) at 2021-09-02 13:45 EEST
Nmap scan report for 10.10.68.52
Host is up (0.10s latency).
Nmap scan report for 10.10.68.121
Host is up (0.16s latency).
Nmap scan report for 10.10.68.125
Host is up (0.089s latency).
Nmap scan report for 10.10.68.134
Host is up (0.13s latency).
Nmap scan report for 10.10.68.220
Host is up (0.11s latency).
Nmap done: 256 IP addresses (5 hosts up) scanned in 17.38 seconds
```

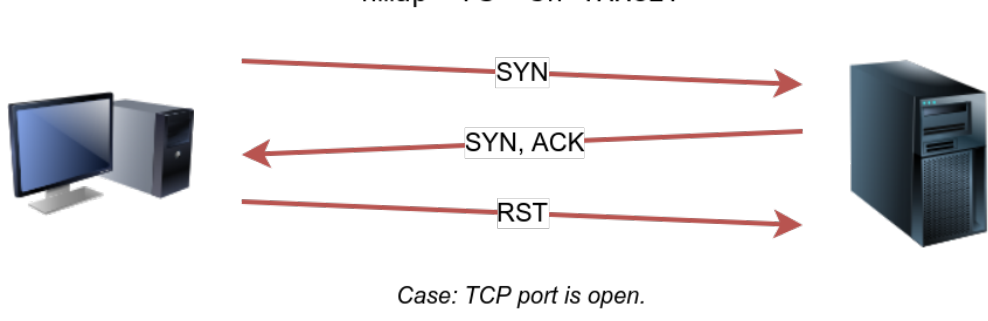

Figure 1: SYN Packet sent for Host Discovery, the user has root privileges.

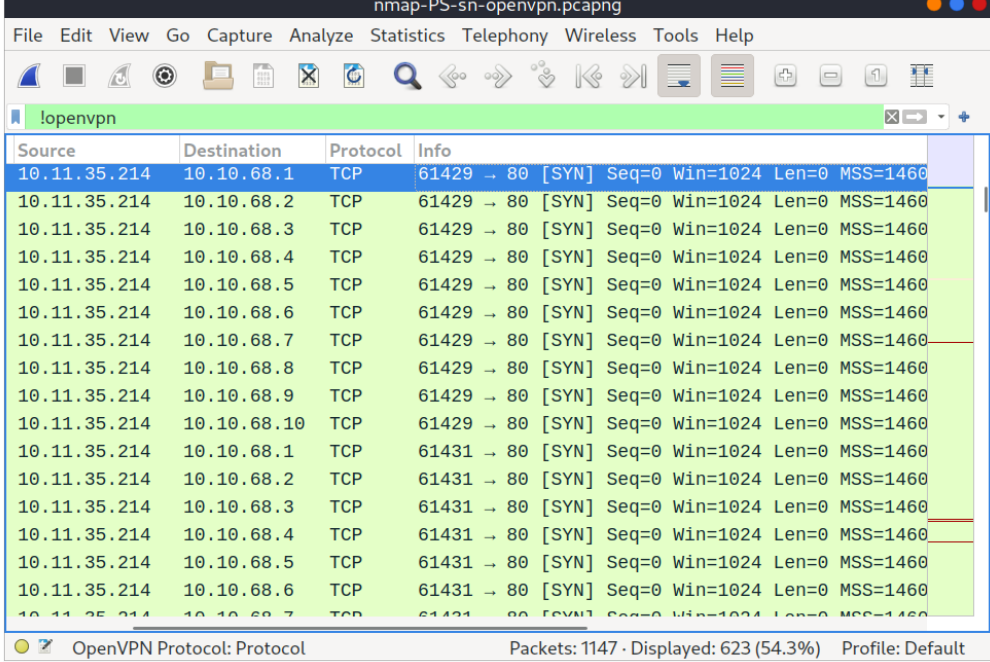

Figure 2: Do you notice how Nmap is sending the SYN packets to port 80? Twice? For each IP in the specified subnet.

2.3.II TCP ACK Scan (-PA)

As you have guessed, this sends a packet with an ACK flag set. Again, by default, Nmap will send the ACK packet to port 80.

TCP ACK Scan (-PA)

```
$ sudo nmap -PA -sn 10.10.68.220/24

Starting Nmap 7.92 ( https://nmap.org ) at 2021-09-02 13:46 EEST
Nmap scan report for 10.10.68.52
Host is up (0.11s latency).
Nmap scan report for 10.10.68.121
Host is up (0.12s latency).
Nmap scan report for 10.10.68.125
Host is up (0.10s latency).
Nmap scan report for 10.10.68.134
Host is up (0.10s latency).
Nmap scan report for 10.10.68.220
Host is up (0.10s latency).
Nmap done: 256 IP addresses (5 hosts up) scanned in 29.89 seconds
```

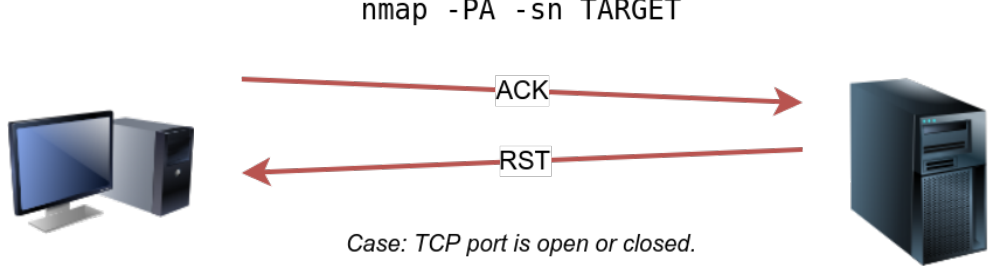

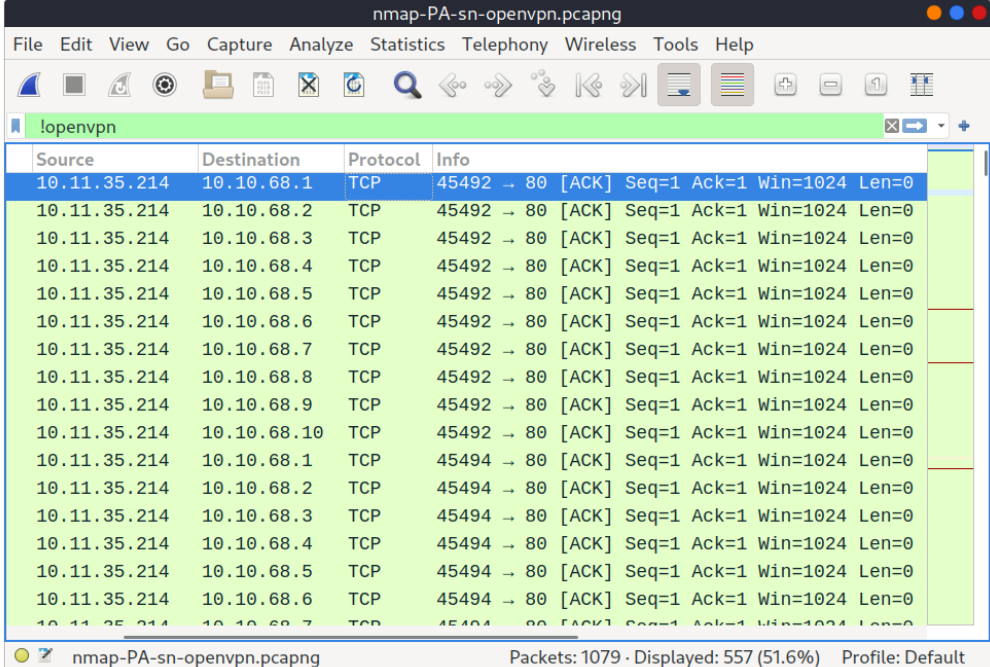

Figure 3: TCP Packet with Ack flag set sent for Host Discovery, doesn't matter whether the port is open or closed

2.3.III UDP Scan (-PU)

Finally, we can use UDP to discover if the host is online. Contrary to TCP SYN ping, sending a UDP packet to an open port is not expected to lead to any reply. However, if we send a UDP packet to a closed UDP port, we expect to get an ICMP port unreachable packet; this indicates that the target system is up and available, and that's exactly why Nmap will be sending to uncommon UDP ports, so that an ICMP destination unreachable is triggered.

UDP Scan (-PU)

```
$ sudo nmap -PU -sn 10.10.68.220/24

Starting Nmap 7.92 ( https://nmap.org ) at 2021-09-02 13:45 EEST
Nmap scan report for 10.10.68.52
Host is up (0.10s latency).
Nmap scan report for 10.10.68.121
Host is up (0.10s latency).
Nmap scan report for 10.10.68.125
Host is up (0.14s latency).
Nmap scan report for 10.10.68.134
Host is up (0.096s latency).
Nmap scan report for 10.10.68.220
Host is up (0.11s latency).
Nmap done: 256 IP addresses (5 hosts up) scanned in 9.20 seconds
```

Figure 4: UDP Packet sent for Host Discovery, port is open and we don't get any reply.

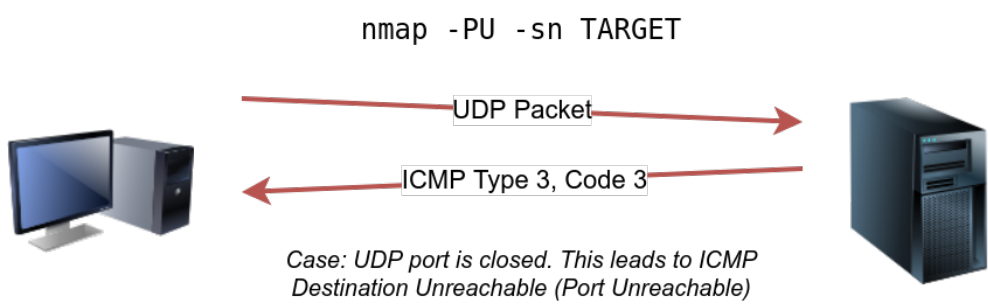

Figure 5: UDP Packet sent for Host Discovery, port is closed and we get a port unreachable packet.

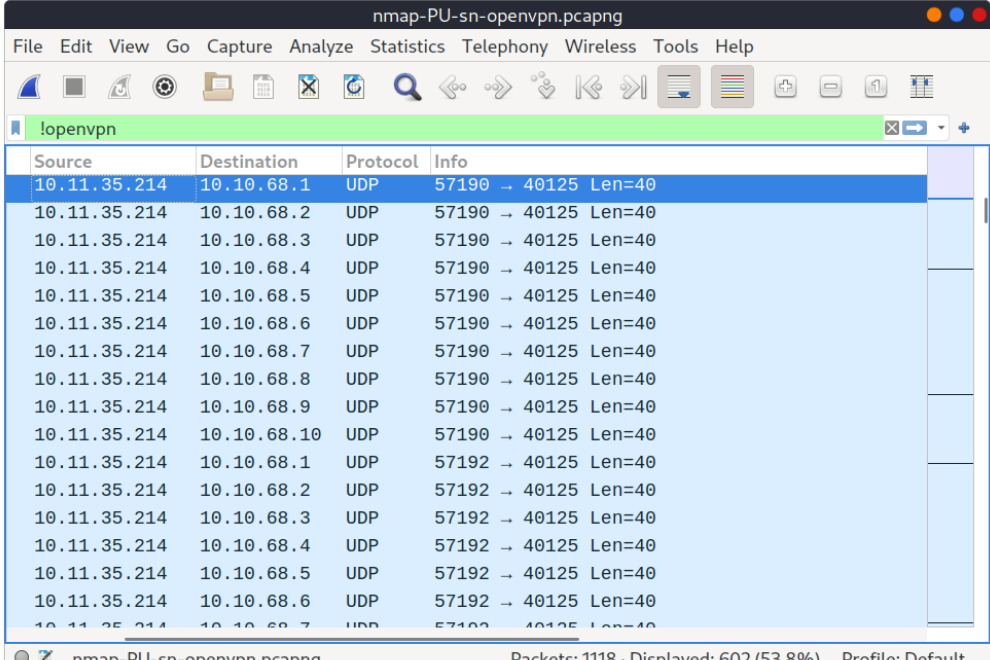

Figure 6: Do you notice how Nmap is sending the UDP packets to uncommon ports multiple times for each IP address in the specified subnet?

4 Basic Port Scanning

- So far when we scanned ports we've seen only the **Open** state, but here's what Nmap also considers:
- **Open:** indicates that a service is listening on the specified port.
 - **Closed:** indicates that no service is listening on the specified port, although the port is accessible. By *accessible*, we mean that it is reachable and is not blocked by a firewall or other security appliances/programs.
 - **Filtered:** means that Nmap cannot determine if the port is open or closed because the port is not accessible. This state is usually due to a firewall preventing Nmap from reaching that port. Nmap's packets may be blocked from reaching the port; alternatively, the responses are blocked from reaching Nmap's host.
 - **Unfiltered:** means that Nmap cannot determine if the port is open or closed, although the port is accessible. This state is encountered when using an ACK scan `-sA`.
 - **Open|Filtered:** This means that Nmap cannot determine whether the port is open or filtered.
 - **Closed|Filtered:** This means that Nmap cannot decide whether a port is closed or filtered.

Figure 1: A closed TCP port responds to a SYN packet with RST/ACK to indicate that it is not open.

Figure 2: SYN scan does not need to complete the TCP 3-way handshake; instead, it tears down the connection once it receives a response from the server.

Figure 3: the UDP ports that don't generate any response are the ones that Nmap will state as open.
